

Removing Cone Marks after an Autocross Weekend

Cone Killers

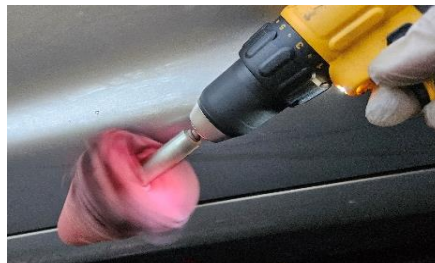

As much as I would like to tell you how good of a driver I am on track days, the truth is the cones get more scared than other competitors do when I come up to the start line. Due to this, I often have cone scuff marks on my car. This is just some plastic transfer and does not hurt the finish, but sure does look unsightly for those of us who use our autocross car for other purposes than just track events. I have developed a pretty quick and easy way to remove them without too much elbow grease. Follow below for the process, the is usually 10-15 minutes for me after each event.

Meguiar's Cleaner Wax
Mothers Power Ball (Or Cone)

Dab the wax on the area where the scuff marks are

Use Drill on high speed setting to buff the marks with the wax using light pressure. Let the speed and the cone do the work. You can follow up with any wax you want and it works on ceramic coated vehicles as well.

Buff off with a microfiber towel to a nice shine and you are good to head off to the car show next.
